TECHNICAL SKILLS

Cloud & DevOps: AWS, AWS API Gateway, AWS AppFlow, AWS CDK, AWS DynamoDB, AWS EventBridge, AWS Lambda, AWS Powertools, AWS S3, AWS SNS, AWS SQS, AWS Step Functions, Docker

APIs & Integrations: DHL, Encompass, FedEx, InteractiveBrokers, Plaid, Polygon, Salesforce, Shopify, Socure, TradingView, Twilio, UPS

Frameworks: Django, Django-Ninja, Express.js, FastAPI, Flask, Vue.js

Testing & Tools: Cryptography, Moto, Pytest, RQ, Selenium

Databases: MongoDB, MySQL, Neo4j, PostgreSQL, RabbitMQ, Redis, Snowflake

Languages: Java, Node.js, PHP, Python

EXPERIENCE

Quantum Lending Solutions

Reston, Virginia, United States

Software Engineer

February 2024 - Present

- Built and maintained financial core services covering loan origination, fraud detection, partner application management, cashflow analysis, and transaction processing (Plaid, MoneyThumb, HyperVerge) using Python, FastAPI, and Django-Ninja on AWS.
- Built an in-house fraud detection service using Neo4j to identify fraudulent loan applications by mapping connections across shared attributes (email, phone, SSN, EIN, addresses, IPs) — integrating PostgreSQL, MySQL, and Snowflake as data sources with graph visualizations and PDF reports via FastAPI.
- Optimized Cypher queries for edge-case fraud graph traversals, reducing execution time from ~11 minutes to ~480ms.
- Built a Plaid-powered payment processor microservice integrated with the legacy Back Office system, reducing overdue portfolio.
- Created an event-driven architecture using RabbitMQ, AWS SQS/SNS, and Kubernetes, improving system throughput and decoupling.
- Automated Salesforce data ingestion via AWS AppFlow, eliminating manual data transfer processes.
- Optimized API endpoints and SQL queries, reducing response latency from ~15 minutes to ~600ms.
- Designed and implemented a pre-underwriting readiness service that automatically evaluates loan applications and bank statements, eliminating manual pre-underwriter checks.
- Led code reviews across the platform team, enforcing design patterns that reduced regression incidents in production.
- Raised test coverage across platform services using Pytest and Moto, reducing production regressions.

Camino Financial

Los Angeles, California, United States

Software Engineer

February 2023 - February 2024

- Maintained and extended the legacy Django Back Office system for the Credit team, resolving bugs and shipping features that unblocked loan processing workflows.
- Designed and implemented a new event-driven architecture using AWS EventBridge and CDK, decoupling services and improving system reliability.
- Built financial core microservices for Plaid and Socure integrations, lead management, and Salesforce sync — routing fraud scores to Salesforce lead objects via AWS EventBridge.
- Improved microservices observability using AWS Powertools, reducing root cause identification time from 3–4 hours to 30–45 minutes per incident.
- Built a serverless pipeline that processes CSV files to generate targeted marketing campaign links with Plaid and Salesforce integrations via AWS Lambda, Step Functions, and EventBridge — enabling the marketing team to launch campaigns for the first time.

Globant

Barranquilla, Atlántico, Colombia

Software Engineer

May 2022 - January 2023

- Built a microservice that evaluates ML model outputs through a decisioning tree and returns human-readable explanations of candidate-to-job compatibility scores using Python, FastAPI, and AWS.

Leanware

Software Engineer

Barranquilla, Atlántico, Colombia

August 2021 - April 2022

- Built a PDF generation web app that batch-processes CSV input to populate document templates using Node.js on GCP, saving users ~2 hours per batch.
- Built a secure file hosting service for sensitive customer documents using end-to-end encryption with AWS KMS, Python, Flask, and AWS Serverless.
- Built a near real-time algorithmic trading bot with 4 custom strategies, integrating Polygon, InteractiveBrokers, and TradingView webhooks for signal processing and order placement at ~650ms per signal using Python and AWS Serverless.

ISWE GROUP

Software Engineer

Buenos Aires Province, Argentina

June 2020 - April 2022

- Built a web scraper that automates FDA Priority Notice webform submissions using Python, Selenium, and RQ — increasing throughput from 1 to 4 submissions per 15 minutes and freeing staff to focus on order processing.
- Built a vehicle broker prototype enabling insurance quote generation by integrating Argentinian SOAP insurance services using Python, Flask, Vue.js, and PostgreSQL.
- Built an inventory management system integrated with Shopify for product tracking and order fulfillment, generating shipping labels via FedEx, DHL, and UPS APIs — helping scale order processing from 10 to 40+ orders per day alongside the FDA automation using Python, Flask, Vue.js, and MongoDB.
- Extended the inventory management system with multi-store support, enabling creation and management of Shopify store clusters.

City Lending Inc

Back End Developer

Barranquilla, Atlántico, Colombia

October 2019 - May 2020

- Automated loan processing and status update workflows for the financial team by integrating the Encompass API using Python and AWS Serverless.
- Built internal loan officer tooling and REST API integrations with the Encompass API using Python, PHP, and AWS Serverless.
- Built a custom Salesforce Lightning chat component integrated with Twilio, used by all loan officers for lead follow-up — implementing webhooks, lead data sanitization, automated loan officer assignment, and dashboards for data visualization using Apex, Node.js, and AWS Serverless.

EDUCATION

Universidad del Norte

Bachelor of Engineering - BE, Computer Science

January 2016 – February 2021
